

# Assessing flood risk globally using an improved country-based risk index

UNESCO-JASTIP Joint Symposium at Manila  
November 15, 2017

Yoshiyuki Imamura

Center for Research and Application of  
Satellite Remote Sensing (CRASS)

Yamaguchi University, Japan

# Introduction

# Increasing water disasters

Number of water-related disasters (1980-2009)

Water-related disasters are **increasing**.  
Especially **damage in Asia** is serious.

# Why do we need to assess flood risk?

Increasing flood damage

ICHARM developed **water-related risk assessment indicators** (Asian Water Development Outlook(AWDO) issued by Asian Development Bank (ADB))

Assessing and quantifying flood risk of countries

• • •

Easy to understand by policy makers and general public

Guiding policy makers and planners for **reducing flood damage and sustainable development**

## AWDO (Asian Water Development Outlook)

- • • Five key dimensions on water security
- KD5: Resilience to water-related disasters

(Resilience)

Reducing water-related risks and minimizing impacts of disasters

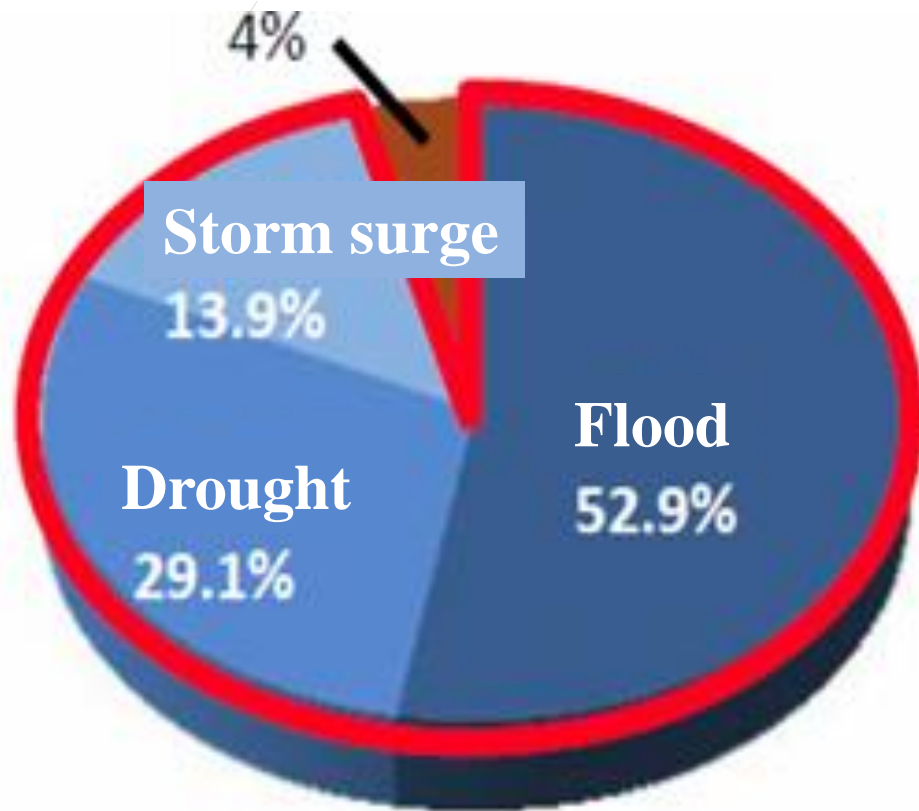

Countries with larger GDP per capita have more resilience to water-related disasters.

Economic development increases resilience to water-related disasters, which supports sustainable development.

# Focusing on floods

※AWDO : evaluated water-related disasters  
(Flood, Drought, Storm surge).

**More than half**  
**damage is caused by**  
**floods**

(affected population)

**Focusing on floods**

**Affected population**  
**(1980-2013)**

# Objectives

## AWDO

- **Limitation** on global datasets.
- **Only** in the **Asia-Pacific** countries.

## Objectives

### ① Improving flood risk index

- • • **Updating data**  
+ Factoring in **more factors**

### ② Applying from Asia-Pacific countries to **the world**

- • • Flood damage is increasing **in other than regions**  
**as well.**

# Methodology

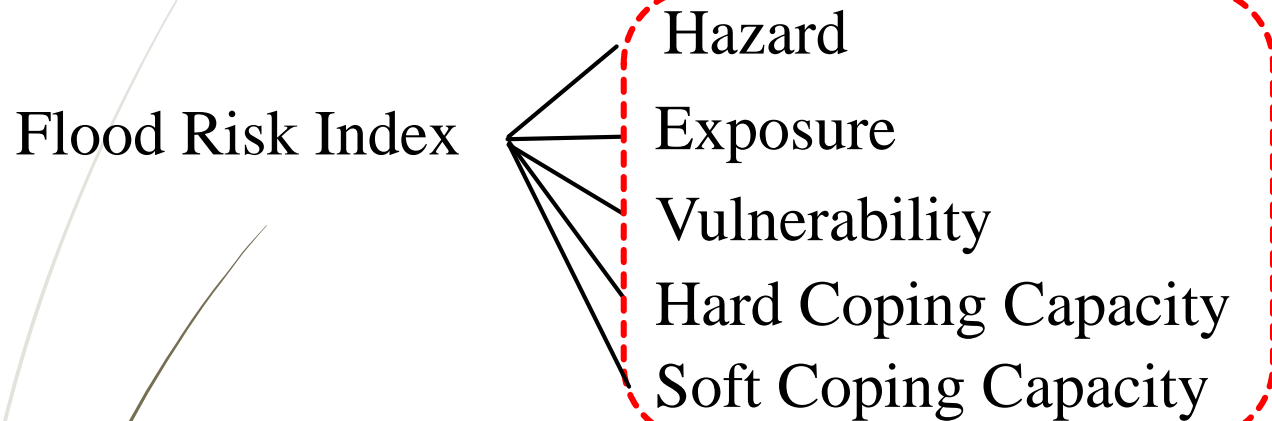

# How the Flood Risk Index is computed

## Indicator and Subindicator

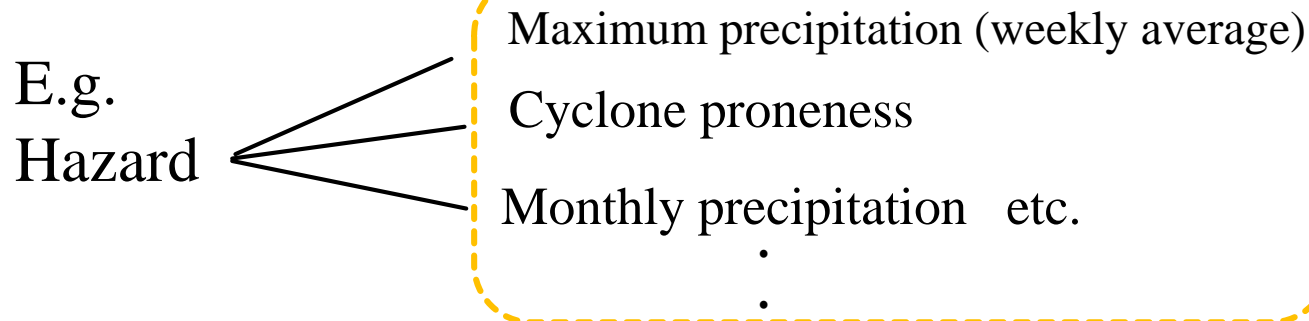

- Indicators

The Flood Risk Index is computed by five indicators.

- Subindicators

An indicator is calculated by subindicators.

# Concept

## Causes and improvements

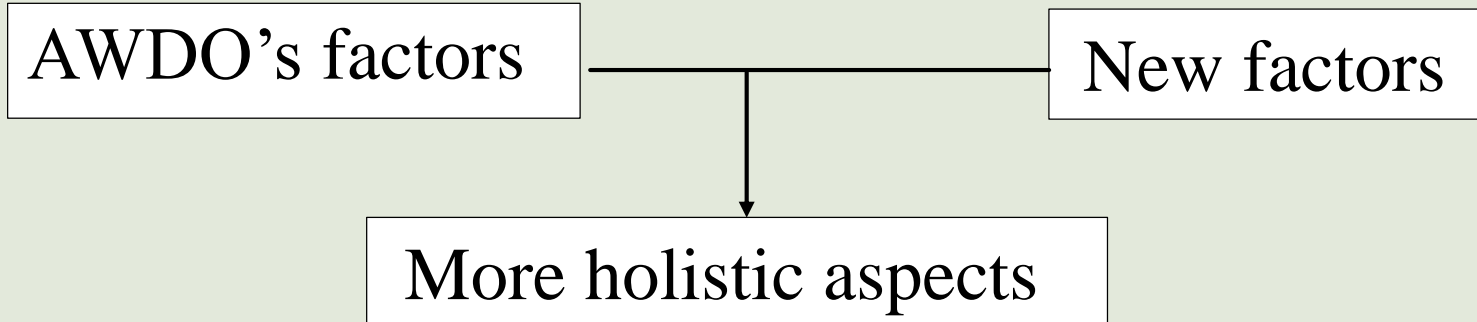

Hazard: Dangerous phenomenon or situation.

People, property, system . . .

# How to compute the Flood Risk Index

## ① Selecting subindicators

## ② Calculating a subindicator from factors (Normalization)

## ③ Calculating an indictor by adding subindicators.

## ④ Computing the index from five indictors

# How to compute the flood risk index from five indicators

$$\text{Flood Risk Index} = \frac{\text{Hazard} \times \text{Exposure} \times \text{Vulnerability}}{\text{Soft Coping Capacity} \times \text{Hard Coping Capacity}}$$

Indicators to **increase** risk

- Hazard : Magnitude of natural phenomena that cause floods
- Exposure : Scale of people or areas exposed
- Vulnerability : Susceptibility to the damaging effects of floods

Indicators to **reduce** risk

- Hard Coping Capacity : Ability to manage flood disasters by structural measures
- Soft Coping Capacity : Ability to manage flood disasters by non-structural measures

# How to calculate a subindicator

e.g. Maximum precipitation (weekly average)

$$\begin{aligned} (\text{Subindicator}) &= \frac{\text{subject country} - \text{minimum country}}{\text{maximum country} - \text{minimum country}} \\ &= \frac{246\text{mm} - 40\text{mm}}{889\text{mm} - 40\text{mm}} = 0.24 \end{aligned}$$

e.g.

**Subject country:** Japan, 246mm,

**Maximum country:** Papua New Guinea 889m,

**Minimum country:** Mongolia, 40mm,

The subindicator is calculated as 0.24.

✂ An indicator is summing up of subindicators

# Indicators and Subindicators

Indicator	Subindicator	Indicator	Subindicator
<b>Hazard</b>	Maximum precipitation ( weekly average)	<b>Hard Coping Capacity</b>	GDP per land area
	Cyclone proneness		Total water storage capacity per land area
	Frequency of heavy rainfall (more than 100mm/day)		<b>Road pavement rate</b>
	<b>Maximum precipitation (monthly average)</b>	<b>Soft Coping Capacity</b>	Literacy rate
	<b>Ratio of the maximum precipitation of monthly average to the minimum</b>		Enrollment rate
	<b>Maximum precipitation of monthly average/Annual average precipitation</b>		Number of television receivers
<b>Exposure</b>	Population density		Number of mobile phone owners
	Urban population growth rate		Percentage of GDS in GDP
	Population growth rate		<b>Internet users</b>
	<b>Inland water area</b>		<b>Public medical expenditure</b>
	<b>Waterway length</b>		
<b>Vulnerability</b>	Corruption perception index	Black: Subindicators used in AWDO Red: New subindicators	
	Percentage of daily consumption less than 1\$		
	Official development assistance ratio		
	Deforestation rate		
	Infant mortality rate		
	<b>Unhealthy life</b>		
	<b>Gini coefficient</b>		

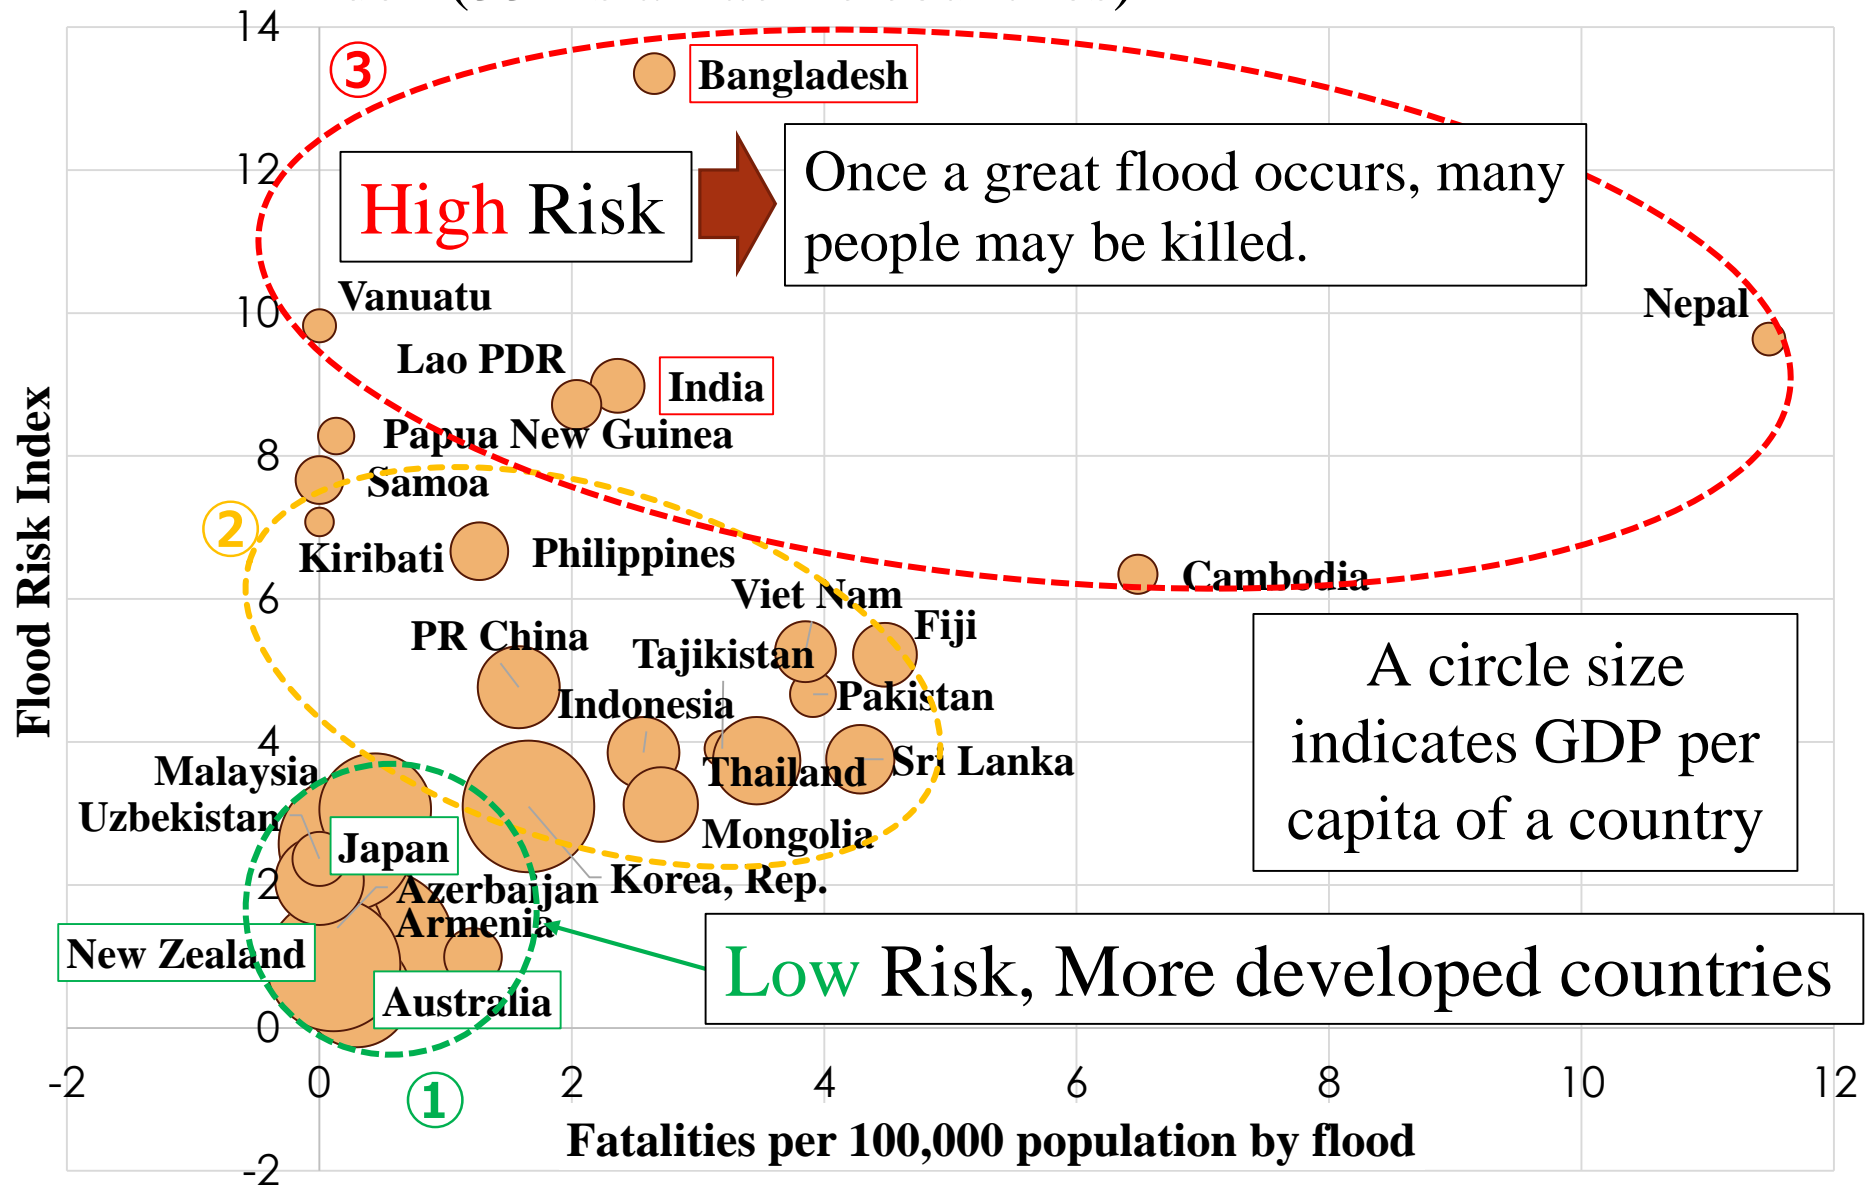

# Results

## (Asia-Pacific countries)

# Result 1

9

Number of fatalities per 100,000 people and flood risk index (33 Asia-Pacific countries)

## Result 2

10

### High risk countries and causes

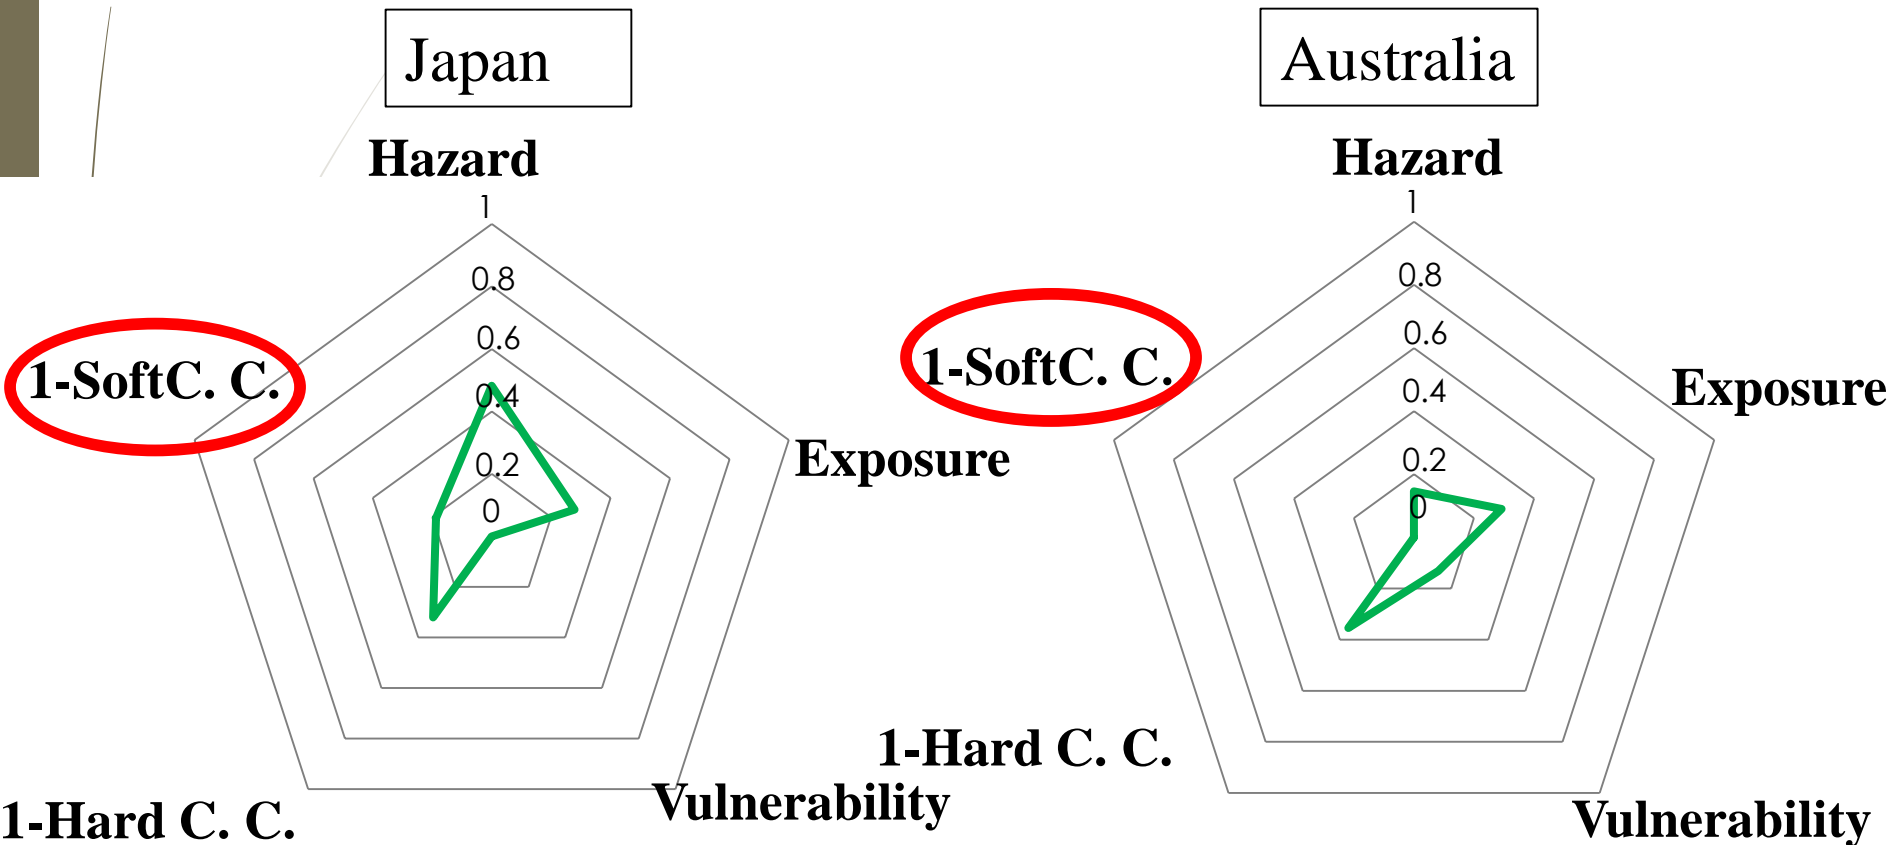

Low literacy rate,  
enrollment rate

Rapid Urban  
population growth

# Result 3

11

## Low risk countries and reasons

## Result 4

12

### Flood Risk Index and five indicators

Increase indicators

Reduction indicators

	Hazard	Exposure	Vulnerability	Hard	Soft
Correlation coefficient $R$	0.88	0.58	0.65	-0.51	-0.75
Coefficient of determination $R^2$	0.77	0.34	0.42	0.26	0.57

“**positive**” with increase factor ,”**negative**” with decrease factor.

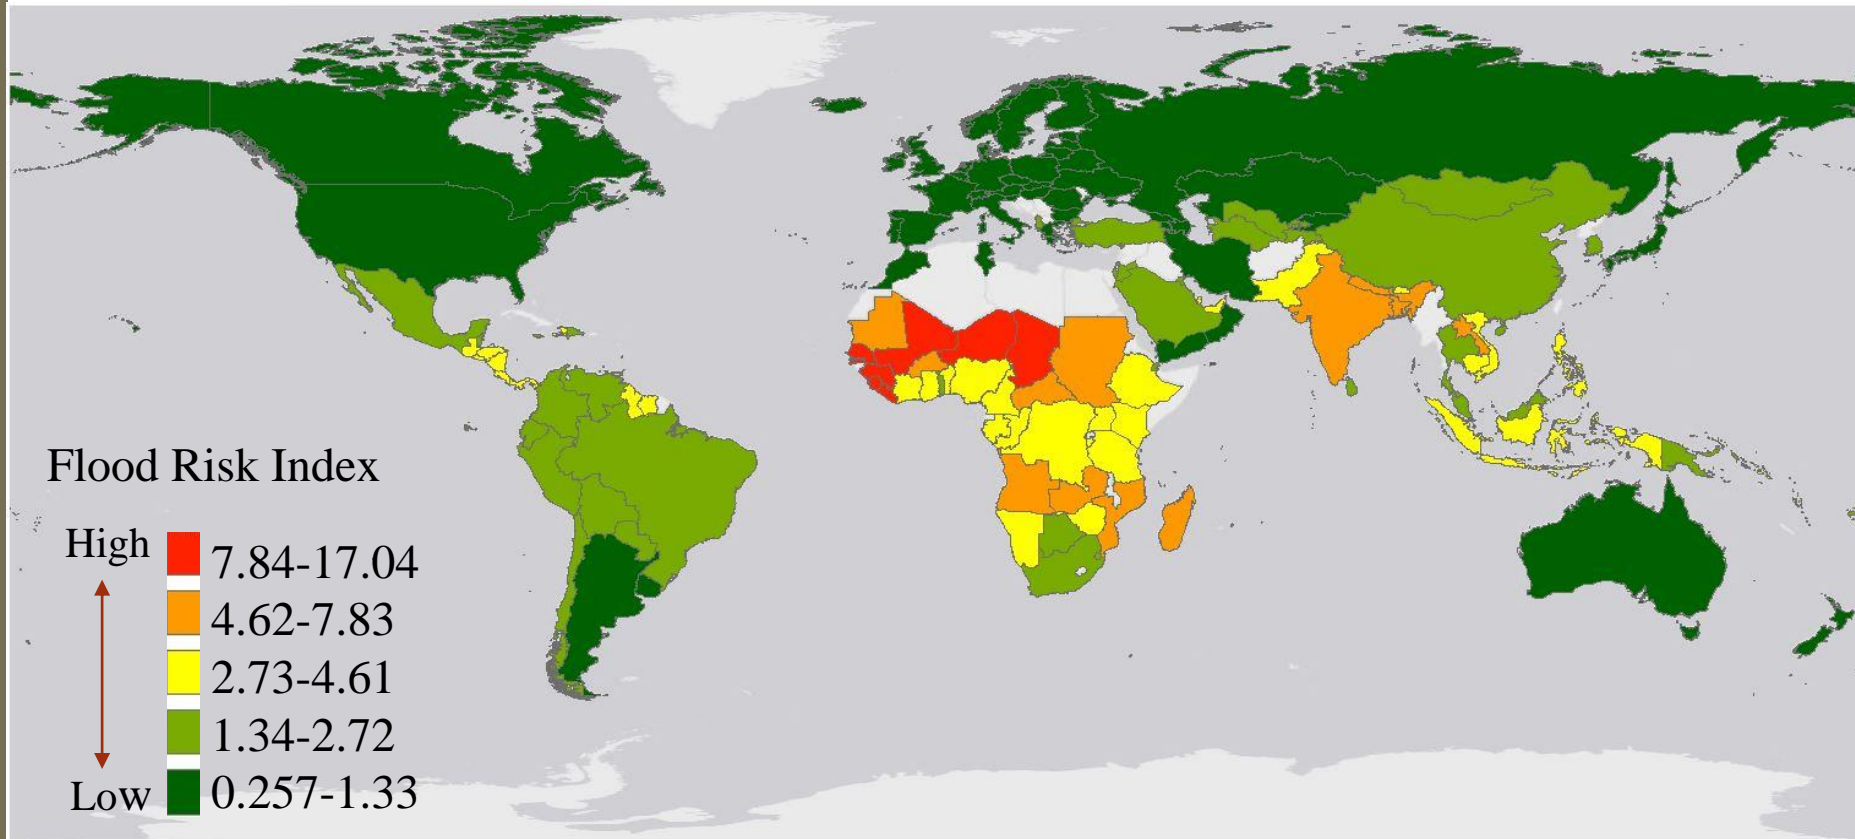

→The subindicators used in the study are reasonable.

## Results (Global)

# Results 1

## Flood Risk Index (146 countries)

**Countries near the equator and in Africa have high Flood Index.**

- • • **High** risk : Central Africa, Pacific countries
- • • **Low** risk : Developed countries, such as Japan, Australia

## Result 2

GDP per capita and flood risk index

# Results 3

**High** risk countries and its factors

# Result 4

Relative high countries with large GDP per capita

United Arab Emirates

Hazard

Qatar

Hazard

High urban population growth  
Rapid deforestation

# Result 5: Indicators by region

**Africa is the highest flood risk region**

⇒ All 5 indicators increase risk highly

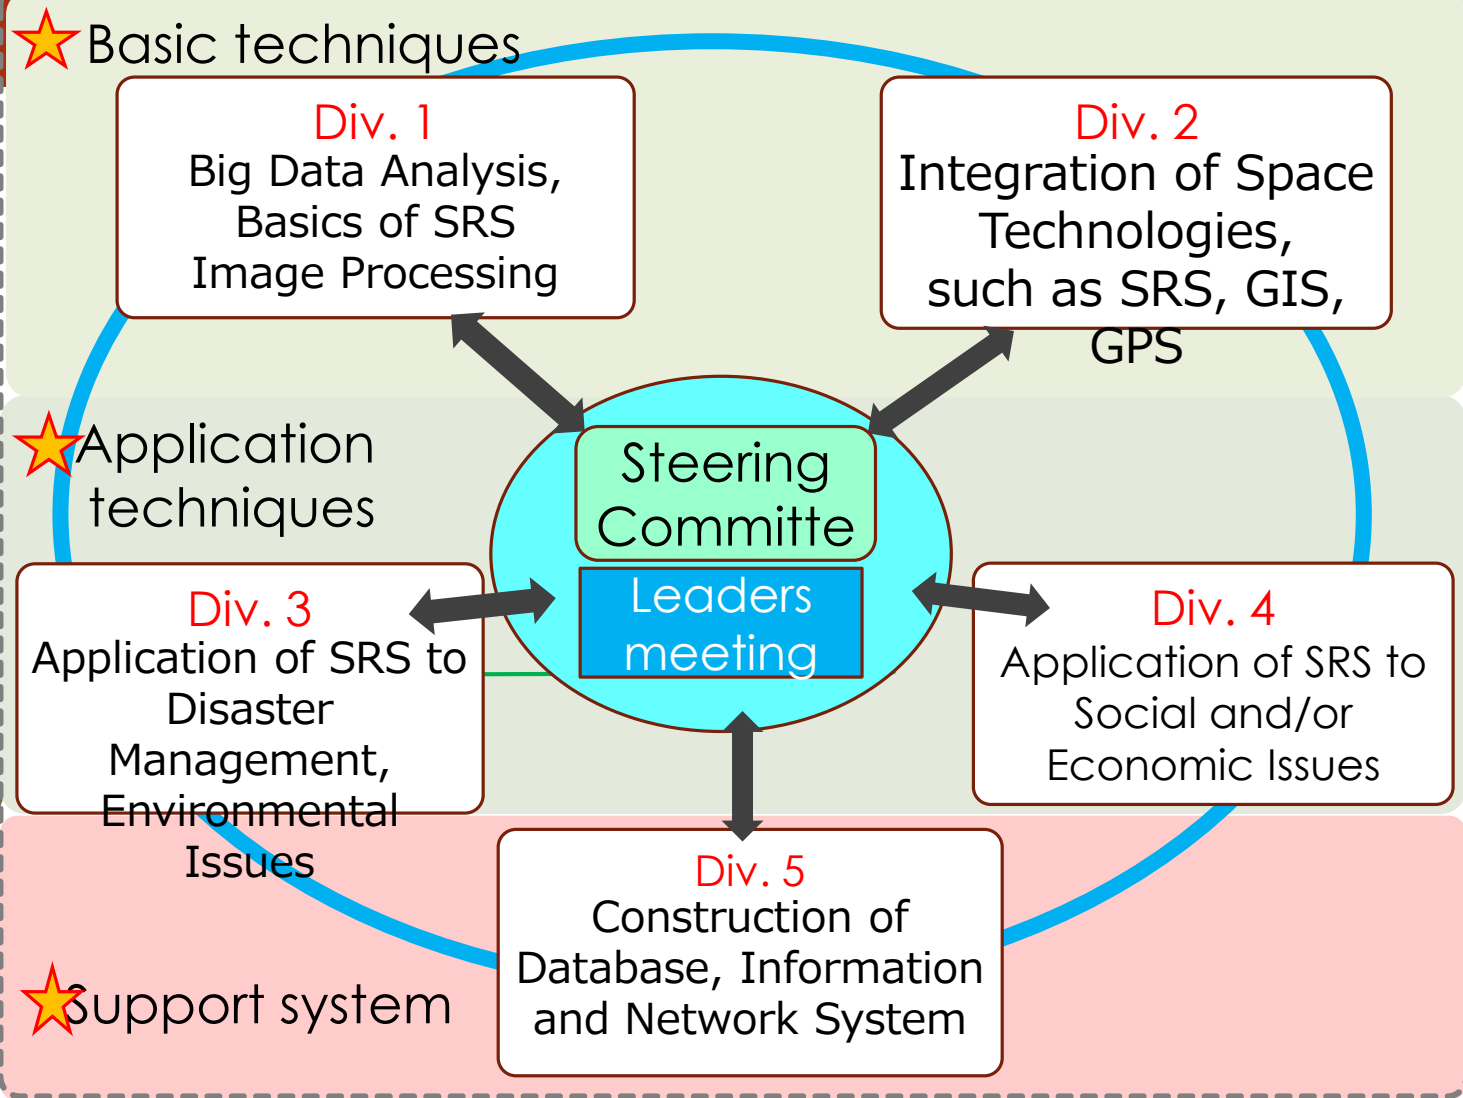

# Conclusion

- Developed the flood risk index that **visualizes causes of risk** and contribute to **national policy** in mitigating damage.
- Applied the developed index to **146 countries** globally and **illustrated features** of countries and regions.

## Way forward

Utilizing **remote sensing data** to complement global datasets  
← **global coverage, updating**  
e.g. GSMaP for precipitation
